

iOS SDK公开课

第四课 路线规划

路径规划

目录

- 选择目的地选择
 - 长按手势
 - 坐标转换
- 路线规划
 - 搜索路线
 - 绘制路线

选择目的地

利用长按手势选择目的地

1. 取得手势屏幕坐标
2. 屏幕坐标转经纬度坐标，获得目的地经纬度

坐标转换接口

MAMapView中

```
/*!
 *brief 将经纬度转换为指定view坐标系的坐标
 *param coordinate 经纬度
 *param view 指定的view
 *return 基于指定view坐标系的坐标
 */
- (CGPoint)convertCoordinate:
(CLLocationCoordinate2D)coordinate toPointToView:(UIView
*)view;

/*!
 *brief 将指定view坐标系的坐标转换为经纬度
 *param point 指定view坐标系的坐标
 *param view 指定的view
 *return 经纬度
 */
- (CLLocationCoordinate2D)convertPoint:(CGPoint)point
toCoordinateFromView:(UIView *)view;
```

选择目的地

长按手势初始化

```
@interface ViewController ()<MAMapViewDelegate, AMapSearchDelegate, UITableViewDataSource,
UITableViewDelegate, UIGestureRecognizerDelegate>
{
    ...
    UILongPressGestureRecognizer *_longPressGesture;
    MAPointAnnotation *_destinationPoint;
}
@end

- (void)initAttributes
{
    _annotations = [NSMutableArray array];
    _pois = nil;

    _longPressGesture = [[UILongPressGestureRecognizer alloc] initWithTarget:self
action:@selector(handleLongPress:)];
    _longPressGesture.delegate = self;
    [_mapView addGestureRecognizer:_longPressGesture];
}
```

手势、目的地标记

长按手势响应

```
- (void)handleLongPress:(UILongPressGestureRecognizer *)gesture
{
    if (gesture.state == UIGestureRecognizerStateBegan)
    {
        CGPoint p = [gesture locationInView:_mapView];
        NSLog(@"press on (%f, %f)", p.x, p.y);
    }
}
```

选择目的地

在长按手势响应中

```
- (void)handleLongPress:(UILongPressGestureRecognizer *)gesture
{
    if (gesture.state == UIGestureRecognizerStateBegan)
    {
        CLLocationCoordinate2D coordinate = [_mapView convertPoint:[gesture
locationInView:_mapView] toCoordinateFromView:_mapView];

        // 添加标注
        if (_destinationPoint != nil)
        {
            // 清理
            [_mapView removeAnnotation:_destinationPoint];
            _destinationPoint = nil;
        }

        _destinationPoint = [[MAPPointAnnotation alloc] init];
        _destinationPoint.coordinate = coordinate;
        _destinationPoint.title = @"Destination";

        [_mapView addAnnotation:_destinationPoint];
    }
}
```

坐标转换

更新目的地标记

选择目的地

搜索路线

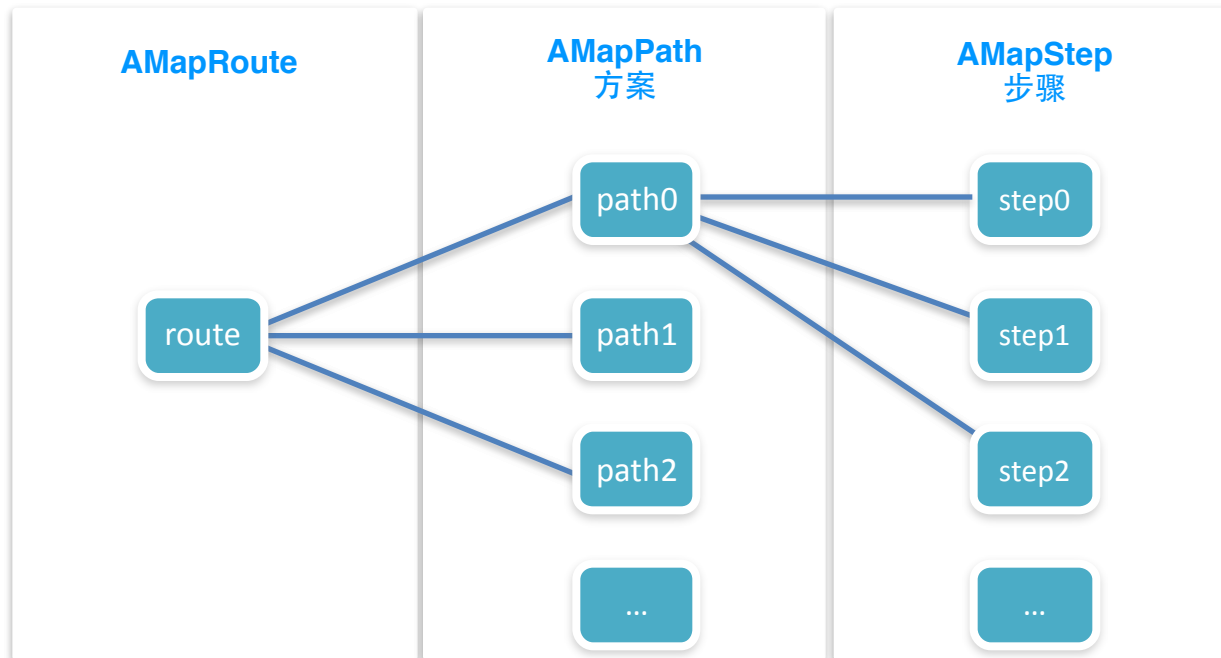

路线搜索类型

AMapSearchType_NaviDrive
AMapSearchType_NaviWalking
AMapSearchType_NaviBus

驾车
步行
公交

返回结果类型AMapRoute

以步行结果举例

搜索路线

添加搜索按钮

```
- (void)initControls
{
    ...
    UIButton *pathButton = [UIButton buttonWithType:UIButtonTypeRoundedRect];
    pathButton.frame = CGRectMake(140, CGRectGetHeight(_mapView.bounds) - 60, 40, 40);
    pathButton.autoresizingMask = UIViewAutoresizingFlexibleRightMargin |
    UIViewAutoresizingFlexibleTopMargin;
    pathButton.backgroundColor = [UIColor whiteColor];
    [pathButton setImage:[UIImage imageNamed:@"path"] forState:UIControlStateNormal];

    [pathButton addTarget:self action:@selector(pathAction)
    forControlEvents:UIControlEventTouchUpInside];

    [_mapView addSubview:pathButton];
}
```

搜索按钮响应方法

```
- (void)pathAction
{
    if (_destinationPoint == nil || _currentLocation == nil || _search == nil)
    {
        NSLog(@"path search failed");
        return;
    }

    AMapNavigationSearchRequest *request = [[AMapNavigationSearchRequest alloc] init];

    // 设置为步行路径规划
    request.searchType = AMapSearchType_NaviWalking;

    request.origin = [AMapGeoPoint locationWithLatitude:_currentLocation.coordinate.latitude
    longitude:_currentLocation.coordinate.longitude];
    request.destination = [AMapGeoPoint locationWithLatitude:_destinationPoint.coordinate.latitude
    longitude:_destinationPoint.coordinate.longitude];

    [_search AMapNavigationSearch:request];
}
```

搜索路线

获取搜索结果

从搜索代理响应方法中获取

```
- (void)onNavigationSearchDone:(AMapNavigationSearchRequest *)request response:(AMapNavigationSearchResponse *)response
{
    if (response.count > 0)
    {
        [_mapView removeOverlays:_pathPolylines];
        _pathPolylines = nil;

        // 只显示第一条
        _pathPolylines = [self polylinesForPath:response.route.paths[0]];
        [_mapView addOverlays:_pathPolylines];

        [_mapView showAnnotations:@[_destinationPoint, _mapView.userLocation] animated:YES];
    }
}
```

解析第一条返回结果

路线解析方法

```
- (NSArray *)polylinesForPath:(AMapPath *)path
{
    if (path == nil || path.steps.count == 0)
    {
        return nil;
    }

    NSMutableArray *polylines = [NSMutableArray array];

    [path.steps enumerateObjectsUsingBlock:^(AMapStep *step, NSUInteger idx, BOOL *stop) {

        NSUInteger count = 0;
        CLLocationCoordinate2D *coordinates = [self coordinatesForString:step.polyline
                                                                    coordinateCount:&count
                                                                    parseToken:@";"];

        MAPPolyline *polyline = [MAPPolyline polylineWithCoordinates:coordinates count:count];
        [polylines addObject:polyline];

        free(coordinates), coordinates = NULL;
    }];

    return polylines;
}
```

解析每一个step

搜索路线

解析经纬度串

```
- (CLLocationCoordinate2D *)coordinatesForString:(NSString *)string
    coordinateCount:(NSUInteger *)coordinateCount
    parseToken:(NSString *)token
{
    if (string == nil)
    {
        return NULL;
    }

    if (token == nil)
    {
        token = @",";
    }

    NSString *str = @"";
    if (![token isEqualToString:@","])
    {
        str = [string stringByReplacingOccurrencesOfString:token withString:@","];
    }

    else
    {
        str = [NSString stringWithString:string];
    }

    NSArray *components = [str componentsSeparatedByString:@","];
    NSUInteger count = [components count] / 2;
    if (coordinateCount != NULL)
    {
        *coordinateCount = count;
    }
    CLLocationCoordinate2D *coordinates = (CLLocationCoordinate2D*)malloc(count * sizeof(CLLocationCoordinate2D));

    for (int i = 0; i < count; i++)
    {
        coordinates[i].longitude = [[components objectAtIndex:2 * i] doubleValue];
        coordinates[i].latitude = [[components objectAtIndex:2 * i + 1] doubleValue];
    }

    return coordinates;
}
```

搜索路线

其中我们用到了`_pathPolylines`记录路线数据

`_pathPolylines`声明

```
@interface ViewController ()<MAMapViewDelegate, AMapSearchDelegate, UITableViewDataSource, UITableViewDelegate,
    UIGestureRecognizerDelegate>
{
    ...
    NSArray *_pathPolylines;
}
```

一个数组，存储
MAPolyline类型

`_pathPolylines`清空

```
- (void)handleLongPress:(UILongPressGestureRecognizer *)gesture
{
    ...
    // 添加标注
    if (_destinationPoint != nil)
    {
        // 清理
        [_mapView removeAnnotation:_destinationPoint];
        _destinationPoint = nil;

        [_mapView removeOverlays:_pathPolylines];
        _pathPolylines = nil;
    }
    ...
}
```

绘制路线

使用MAPolyline记录并绘制路线

MAPolyline

在地图上绘制线的数据模型，是地图覆盖物（MAOverlay）的一种

MAPolylineView

在地图上绘制线的样式，是MAOverlayView的一种

使用步骤

1 添加polyline

```
/*!
 * @brief 向地图窗口添加Overlay，需要实现MAMapViewDelegate的-mapView:viewForOverlay:函数来生成标注对应的View
 * @param overlay 要添加的overlay
 */
- (void)addOverlay:(id <MAOverlay>)overlay;

/*!
 * @brief 向地图窗口添加一组Overlay，需要实现BMKMapViewDelegate的-mapView:viewForOverlay:函数来生成标注对应的View
 * @param overlays 要添加的overlay数组
 */
- (void)addOverlays:(NSArray *)overlays;
```

2 实现MAMapView回调

```
- (MAOverlayView *)mapView:(MAMapView *)mapView viewForOverlay:(id<MAOverlay>)overlay
```

目前已经在获取并解析搜索结果后，添加polyline到地图
接下来实现MAMapView的回调方法

绘制路线

实现MAMapView回调方法

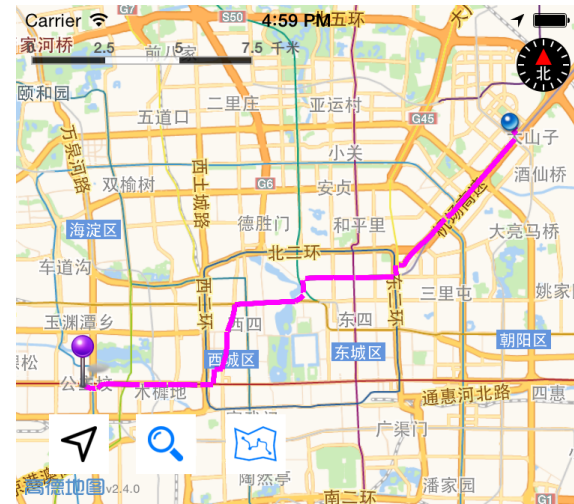

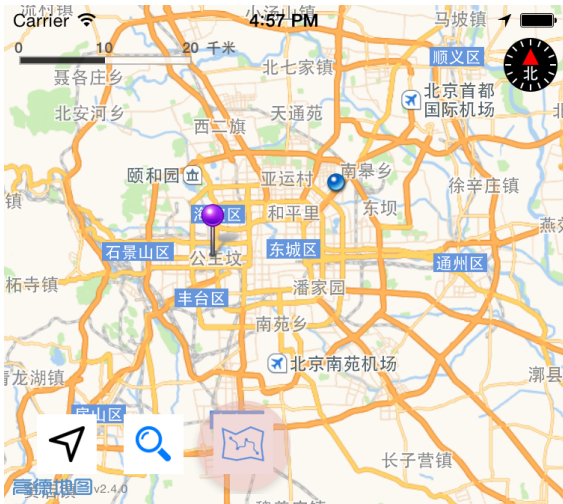

```
- (MAOverlayView *)mapView:(MAMapView *)mapView viewForOverlay:(id<MAOverlay>)overlay
{
    if ([overlay isKindOfClass:[MAPolyline class]])
    {
        MAPolylineView *polylineView = [[MAPolylineView alloc]
initWithPolyline:overlay];

        polylineView.lineWidth = 4;
        polylineView.strokeColor = [UIColor magentaColor];

        return polylineView;
    }

    return nil;
}
```

搜索和绘制路线

作业

添加功能

测量polyline的总长度（单位：米）
